

[Jasenn, Avalyn, 'Crystal Lamp',
2020, Graphite & Colored
Pencil on Smooth Paper]

> A decorative lamp, designed for both aesthetic appeal and to provide light as long as a standard light bulb (sold separately) is screwed in, and the cord is plugged into an electrical outlet.

>> lightbulbs must be replaced periodically, and electricity must be paid for; therefore there is a continuous recurring cost required for the lamp to provide light. It is also limited to being placed it's cord's-distance away from an electrical outlet (however extension cords do exist).

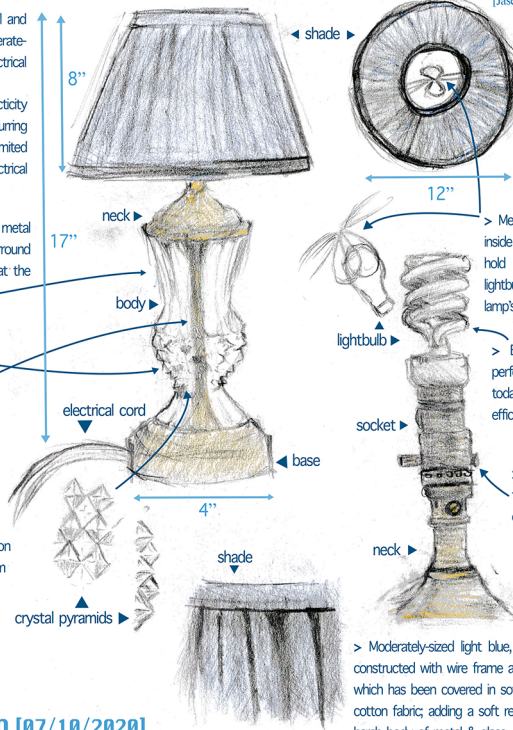

> Plastic & fabric construction of shade looks opaque but is thin enough to allow an abundance of soft diffused light to filter through.

> Metal wires attached to inside of the shade lightly hold the shade on the lightbulb, screwed into the lamp's socket.

> Electrical components are perfectly compatible with today's modern energy efficient lightbulbs.

> Original, simple plastic toggle switch sets light to on/off position.

> Moderately-sized light blue, cone-shaped lampshade, constructed with wire frame and a plastic shade which has been covered in soft blue, pleated, cotton fabric; adding a soft relief from the harsh body of metal & glass.

> The main structure of the lamp is held together by the metal base and neck, screwed to the metal center rod which surround the electrical wires as they must connect to the socket at the very top.

> Concave vertical grooves in glass body lead down to 'half-globe' made of small outward-pointed pyramids

> Bright, cold crystal body of lamp contrasts with warm brassy-gold sheen of the metal base and neck. The metal of the center rod housing the electrical wires can even be seen hazily through the crystal body.

>> The crystal body catches light & it's varying shapes reflect the light in many directions causing different shadows and accents in the glass depending on the lamp's surroundings and the angle it is viewed from

Authentic 24% Lead Zajecar
Crystal Glass ca.1970s
Made in: Yugoslavia
Life: ~50-100 yrs
